

## Deliverable 5

From the customer meeting held last week, we believe that there are no major changes needed for the next MVP 2 meeting. The customer group was happy with the product we delivered and had a few suggestions that they wanted us to implement. Below we will outline some changes they recommended, if we are going to implement them, and how we plan to implement them.

The customer group's main concern had to do with content and how new content would be added. The main concern they had was whether or not users would be able to submit their own content and how we would filter it. In response to this, we agreed to implement a section where users can either recommend topics for us to add or submit their own content that they would us to add to the app. To do this, we plan on implementing a user feedback page where they can submit recommendations on what to add and also a place to send content they created that they would like added. In terms of timeline for this addition, we plan on implementing this on the last leg of our sprints. Our main concern is adding content and being able to save them offline. If we do not get to this, we can add a simple contact page where we can take in user feedback.

Another recommendation that the customer group had was adding a search functionality that would sift through our existing content to allow users to more quickly find their desired documents. Again, we plan to implement this in our last sprint as it is not the top of our priorities. We plan to implement this by adding tags to each of our documents similar to how youtube has tags on videos to allow for easier searches. The user will then search keywords and be given documents whose tags match the terms searched

Another recommendation that we are taking into account is adding videos to our app. The customer group suggested adding it for more complicated tasks. We do not plan on allowing for this to be saved offline but we will attempt to implement it. We are planning on adding another category for videos when clicked will route you to youtube where the video can be found. This has low priority so we may not get to it.

Our main focuses for this last sprint are to add the functionality to save offline and to expand our categories and content found in them. This is what has the highest priority because this is the main focus of our app. Without the ability to store offline, our app would simply be a blog with relevant material. From the research we have done, implementing this option needs an input from the user that allows us to access their phone's memory. We also need to vet material that we want to add to the app. We need to make sure the material is correct and succinct so if it were saved offline, it would not take much memory up.

All of the tasks laid out above are what we plan to implement for our final product due for MVP 2. In summary, what absolutely needs to be implemented are the ability to save offline and adding more documents in correct categories.
